The screenshot shows the DBeaver 25.2.4 interface with a PostgreSQL database. The main window displays a SQL script titled "Script-3" with the following query:

```
EXPLAIN SELECT
  b.id_barco,
  b.nome AS barco,
  COUNT(DISTINCT v.id_viaxe) AS total_viaxes,
  COUNT(r.id_reserva) AS total_reservas,
  COALESCE(SUM(r.total_pagado), 0) AS ingresos_totais,
  AVG(v.fecha_chegada - v.fecha_salida) AS duracion_media_dias
FROM cruceiros.barcos b
  JOIN cruceiros.viaxes v
    ON v.id_barco = b.id_barco
  LEFT JOIN cruceiros.reservas r
    ON r.id_barco = v.id_barco
    AND r.id_viaxe = v.id_viaxe
GROUP BY b.id_barco, b.nome
ORDER BY ingresos_totais DESC;
```

Below the query, the "Resultados 1" tab shows the "QUERY PLAN" for the executed query. The plan details the execution strategy, including a Sort operation, a Custom Scan (Citius Adaptive), a GroupAggregate, a Merge Left Join, a Merge Join, an Index Scan, and several Seq Scans on the underlying tables.

At the bottom of the interface, the status bar indicates that 20 rows were fetched in 0.0s on 2025-12-04 at 19:38:35. The bottom-most bar shows the current schema as "CET es_ES Editable" and the selected table as "Inserció...eligente".
